# Funksiya tushunchasi va berilish usullari

Agar bir o'zgaruvchi x ning har bir qiymatiga boshqa o'zgaruvchi miqdor y ning to'la aniq qiymati biror usul bilan mos keltirilgan bo'lса, bu holdа bu funksiya berilgan deyiladi. Bunda o'zgaruvchi y miqdor funksiya, x miqdor esa argument deb ataladi va quyidagicha belgilanadi:

$$y = f(x)$$

$y = f(x)$  funksiyaning  $x$  argumenti qabul qilishi mumkun bo’lgan barcha qiymatlar to’plami bu funksiyaning aniqlanish sohasi deyiladi.  $y$  funksiyaning o’zi qabul qiladigan qiymatlar to’plami bu funksiyaning o’zgarish sohasi deyiladi. Masalan,  $y = \sin x$  funksiyaning aniqlanish sohasi barcha haqiqiy sonlar to’plamidan iborat, o’zgarish sohasi esa  $[-1;1]$  bo’ladi.

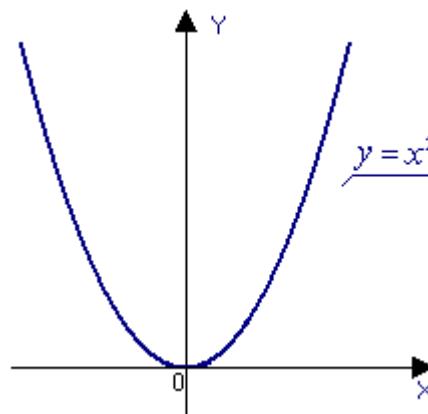

# Funksiyaning berilish usullari:

1. Analitik ko'rinishda:  $y = f(x)$ ;  $y = x^2$

2. Jadval ko'rinishda:

$x$	-1	0	1	3
$y$	1	0	1	9

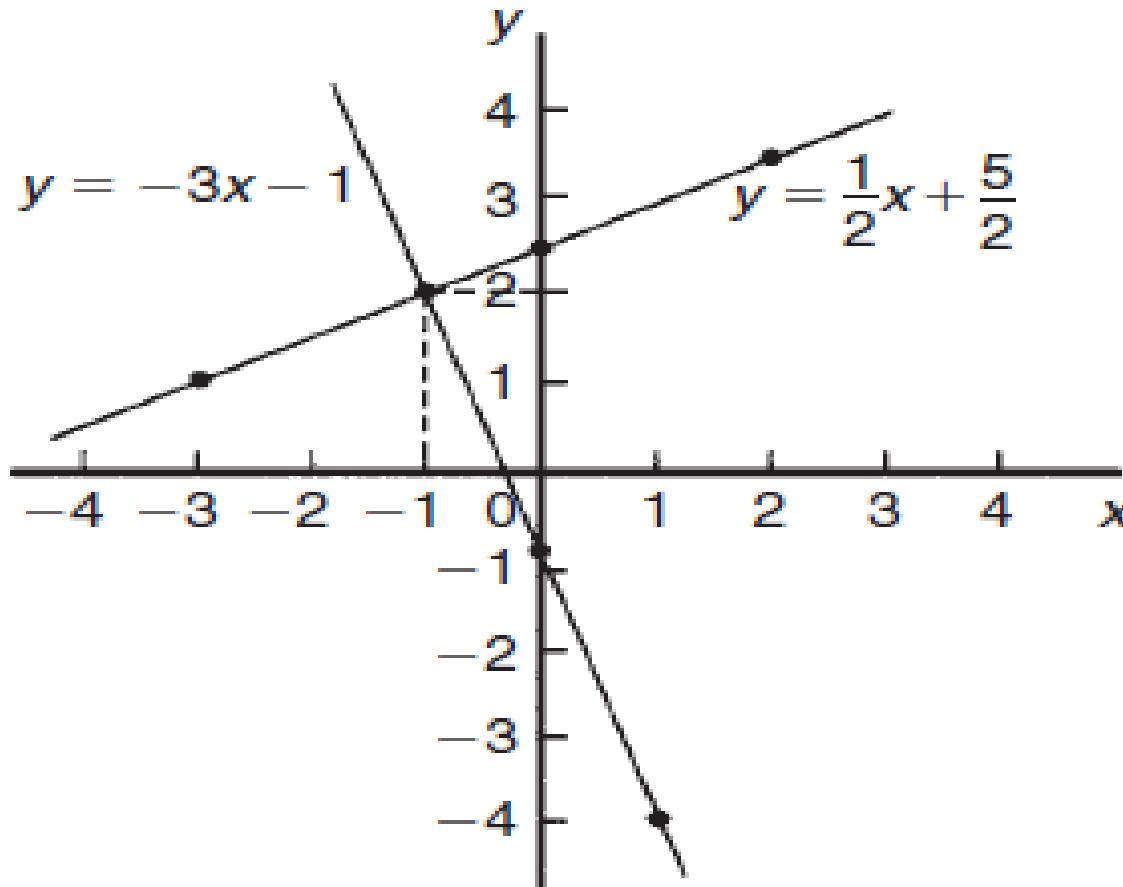

3. Grafik ko'rinishda:

# Chiziqli funksiyalar

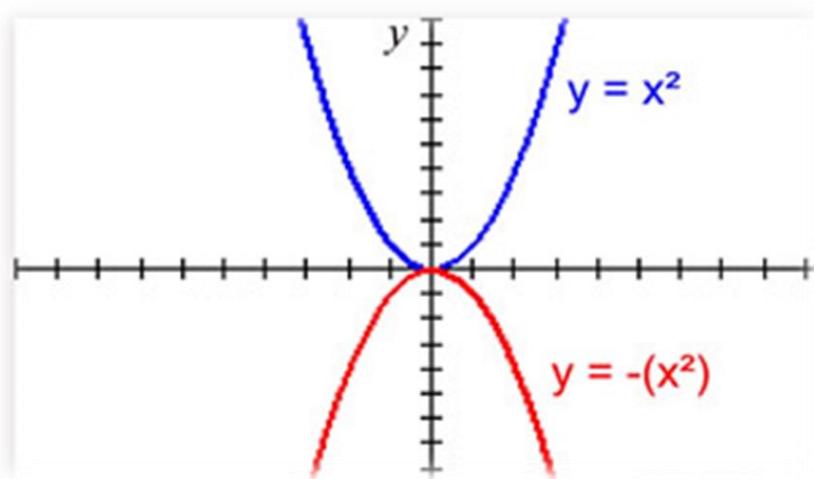

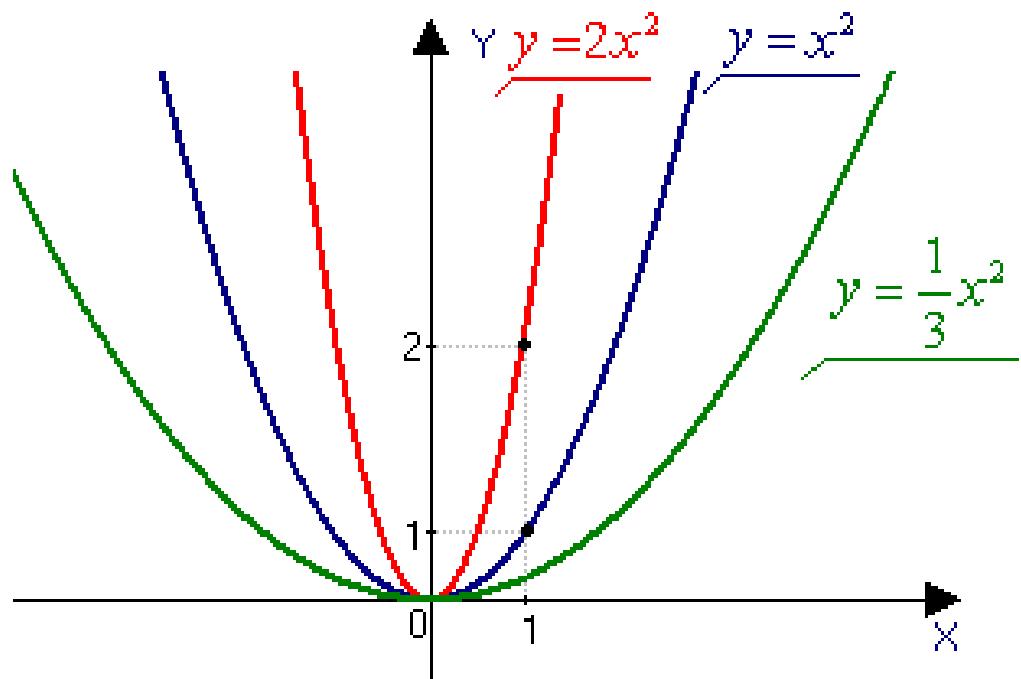

$$y = ax + b$$

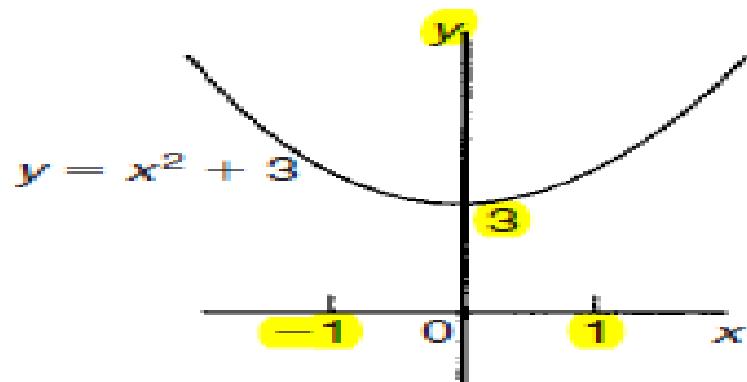

# Kvadrat funksiyalar

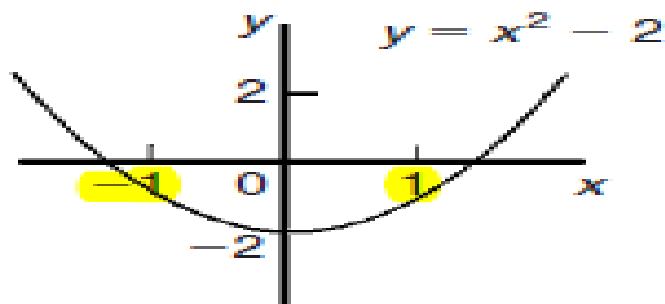

$$y = ax^2$$

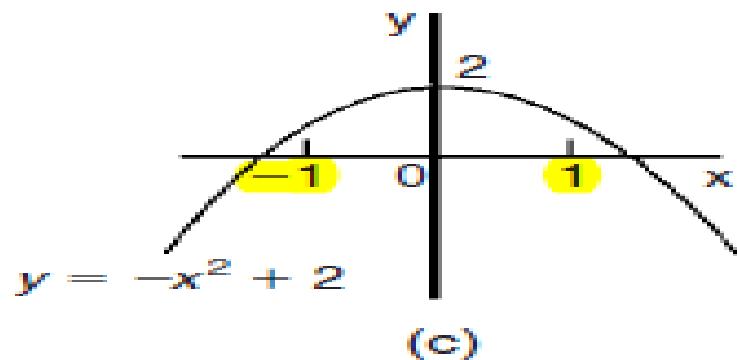

$$y = ax^2 + c$$

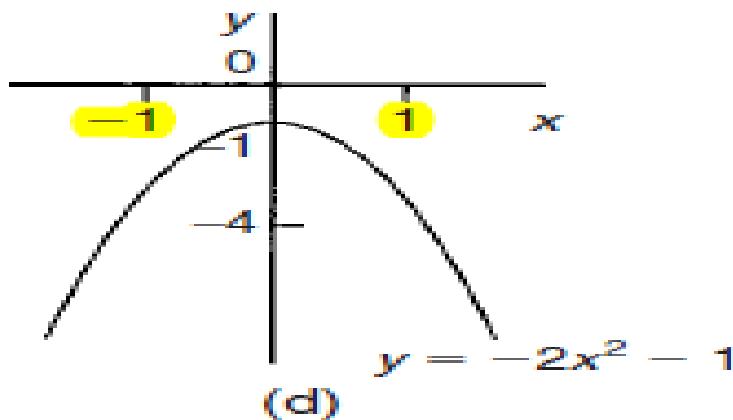

(a)

(b)

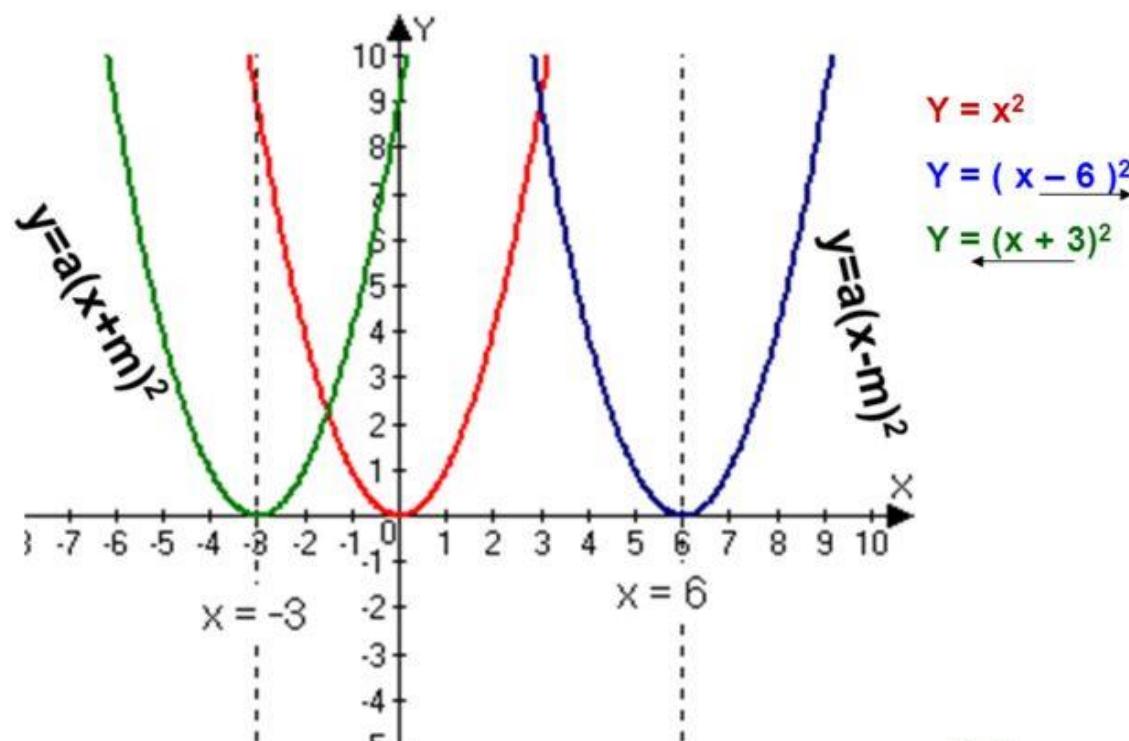

(c)

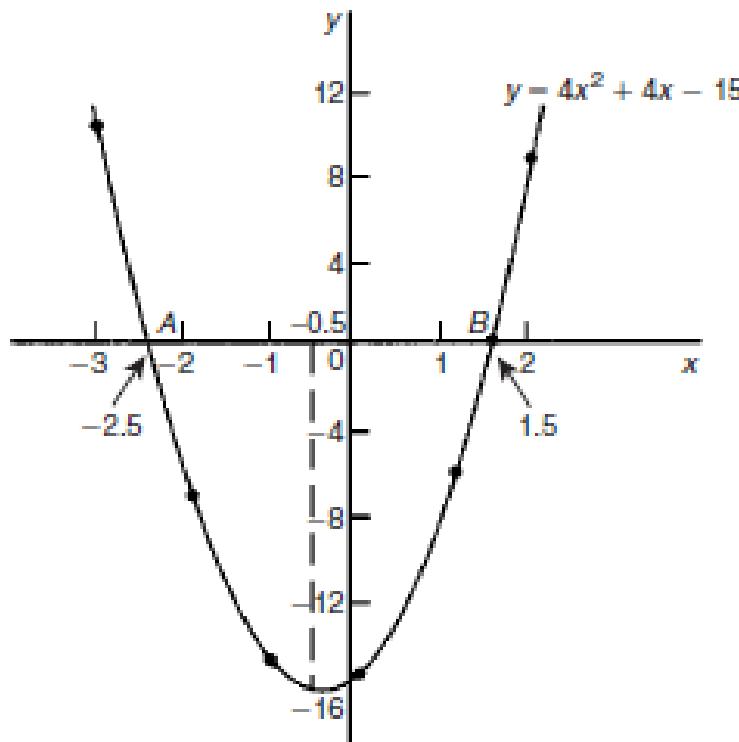

(d)

$$y = a(x + m)^2$$

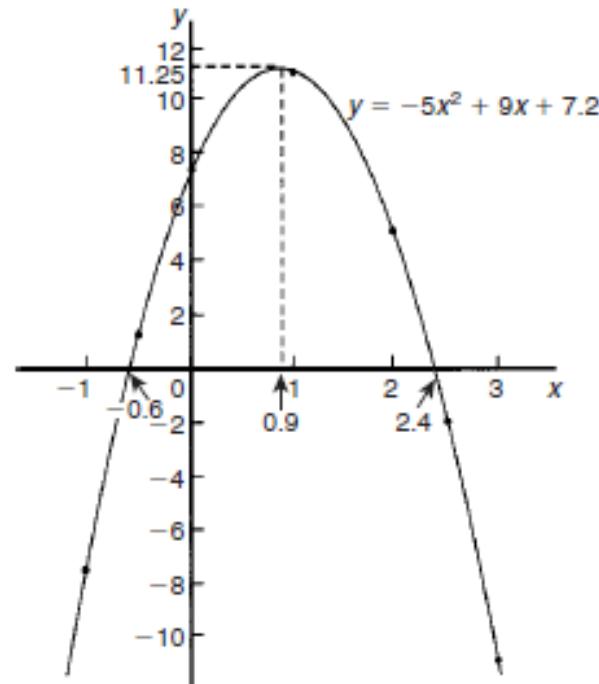

$$y = a(x - m)^2$$

$$y = a(x + m)^2 + k$$

$$y = 4\left(x + \frac{1}{2}\right)^2 - 16$$

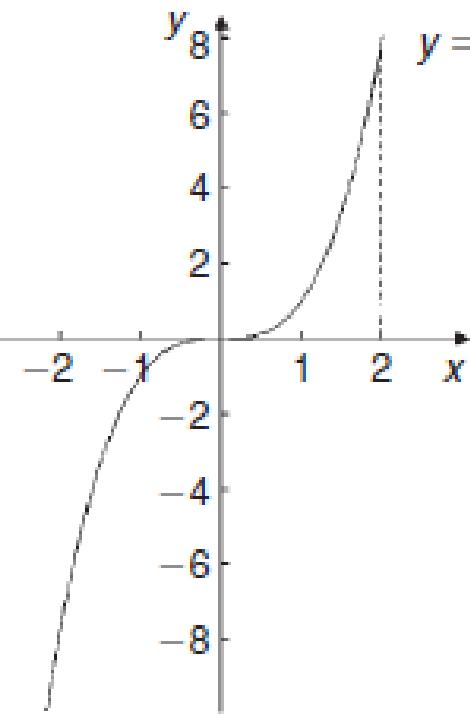

$$y = -5(x - 1.8)^2 + 23.4$$

Ko'rsatkichli funksiya

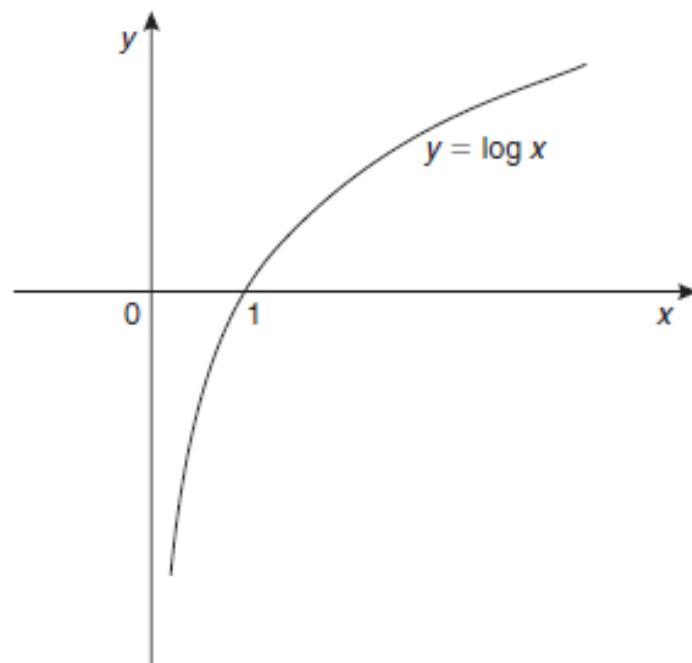

Logorifmik funksiya

Kubik parabola

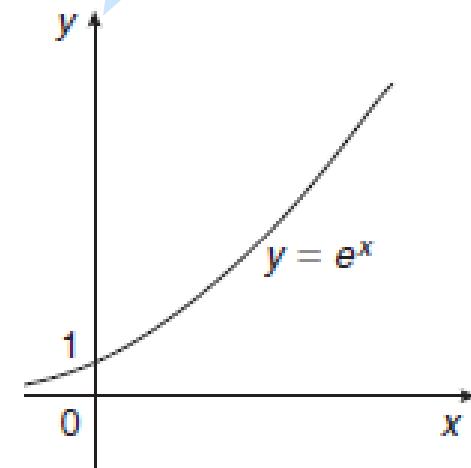

$$y = x^3$$

$$y = \log x$$

$$y = e^x$$

# Sonli ketma-ketliklar tushunchasi

Har bir natural n songa biror haqiqiy  $x_n$  sonini mos qo`yuvchi

$$(1) \quad f : n \rightarrow x_n, \quad (n=1, 2, 3, \dots)$$

akslantirishni qaraymiz.

**Ta`rif.** 1- akslantirishning akslaridan iborat ushbu

$$(2) \quad x_1, \quad x_2, \quad x_3, \quad \dots, \quad x_n, \quad \dots$$

to`plam **sonlar ketma-ketligi** deyiladi. Uni  $\{x_n\}$  yoki  $x_n$  kabi belgilanadi.  
 $x_n$  ( $n=1, 2, 3, \dots$ ) sonlar (2) **ketma-ketlikning hadlari** deyiladi. Masalan,

$$x_n = (-1)^n : -1, 1, -1, \dots, (-1)^n, \dots$$

$$x_n = \sqrt[n]{n} : 1, \sqrt{2}, \sqrt[3]{3}, \dots, \sqrt[n]{n}, \dots$$

**(2) Sonli ketma-ketlik monoton o'suvchi deyiladi, agarda har bir  $n$  uchun quyidagi tengsizlik o'rinni bo'lsa**

$$x_{n+1} > x_n$$

**Masalan,**  $x_n = \frac{n}{n+1}$ .

**Sonli ketma-ketlik monoton kamayuvchi deyiladi, agarda har bir  $n$  uchun quyidagi tengsizlik o'rinni bo'lsa**

$$x_{n+1} < x_n$$

**Masalan,**  $x_n = \frac{n}{n^2 + 1}$

**2-sonli ketma-ketlikning  $x_n$  qiymati yuqoridagi shartlarni bajarmasa u holda, (2) ni monoton bo'lмаган ketma-ketlik deyiladi.**

**Masalan,**  $\frac{1}{3}, -\frac{4}{9}, \frac{9}{27}, -\frac{16}{81}, \frac{25}{243}, \dots$

(2) Sonli ketma-ketlik chegaralangan deyiladi, agarda shunday 2ta  $m$  va  $\mathcal{M}$  sonlar mavjud bo'lsaki, barcha  $n$  lar uchun quyidagi tengsizlik o'rinali bo'lsa

$$m \leq x_n \leq \mathcal{M}$$

Masalan,  $x_n = \frac{3n+2}{3n}; \quad 1 < x_n \leq \frac{5}{3}$
