CONSERVATION OF LIVING RESOURCES

Conservation of living resources means using them in such ways that valuable plants and animals are maintained for future generations.

CONSERVATION OF LIVING RESOURCES

- **To survive, every species must modify its environment. So, environmental modification is a natural process, it is a necessary part of development. It is inevitable that most of the planet will be modified by people. However, this modification may have some harmful side-effects. To conserve the environment is to find such ways of development which will at the same time conserve the living resources essential for man.**

Soil

Soil is of the greatest importance in the life of people, as all food production depends on it.

Soil

SOIL EROSION IS A NATURAL PROCESS, BUT USUALLY THE SOIL IS REGENERATED IF THERE IS ENOUGH VEGETATION. IF SOIL AND VEGETATION ARE NOT IN BALANCE AS A RESULT OF POOR SOIL MANAGEMENT, THE SOIL IS LOST.

PEST CONTROL

Pest control is another important problem. Chemicals are an effective means of control, but if too high doses of pesticide are applied, it may produce undesirable effect. Too high doses of pesticide destroy natural pest enemies and may contaminate food and feed. Besides, these pesticides may become less effective after some time. That is why chemical control methods should be combined with the introduction of pest-resistant crop varieties, the use of repellents and hormones, the encouragement of natural pest enemies and other biological and mechanical control measures.

SOIL CONSERVATION SERVICE

***Such and similar problems should be considered by a special
soil conservation service.***

SOIL CONSERVATION SERVICE

THIS SERVICE SHOULD OPERATE IN EACH COUNTRY. IT SHOULD BE ABLE NOT ONLY TO GIVE RECOMMENDATIONS, BUT ALSO TO INFLUENCE THE AGRICULTURAL POLICY AND THE DECISIONS ON SECURING FOOD SUPPLIES.
