Table of Contents

Preface III International Scientific and Practical Symposium "Materials Science and Technology" (MST-III-2023)

Shahriyor Sadullozoda, Arthur Gibadullin, and Dmitry Morkovkin	010001
Differential thermal analysis of the lead-silica oxide system to synthesis colored glasses Khidir Adinaev, Zulayha Kadyrova, Sadoqat Vokhidova, Diyorbek Absattorov, Yulduz Khidirova, and Murodjon Samadiy	020001
The method of assembly an equal number of parts of eponymous dimensional groups Nadezhda Chigrik	020002
Research of photoarylotropy of 5-aryloxynaphtho[1,2,3-cd]indole-6(2H)-ones Olga Kargina, Elena Pritchina, Olga Fominykh, and Leonid Gornostaev	020003
Dosing of oxygen concentrations by electrochemical method on superionics Aitbay Rakhymbekov and Yerlan Andasbayev	020004
Calculation of thermal fluxes of arc radiation over the surface and depth of the bath of electric arc steelmaking furnaces Anatoly Makarov, Victoria Okuneva, and Julia Pavlova	020005
Modeling of thermal diffusion process in the presence of volumetric heat release Yu. A. Kostikov and A. M. Romanenkov	020006
Structure the lime composite in the presence of the addition of a polysilicate solution Maria Zaytseva and Valentina Loganina	020007
Stress state of paint coatings depending on their surface roughness Maxim Ariskin, Maria Svetalkina, and Valentina Loganina	020008
Relationship between the structure and properties of plaster mortar based on lime-sand mixture modified with redispersible polymer powder Varvara Rumyantseva, Dmitrii Panchenko, Yuliia Panchenko, Boris Narmaniya, and Yuliia Loseva	020009
Effect of HPT and annealing on microstructure and mechanical properties of Zr-2.5Nb alloy V. V. Titov, D. V. Gunderov, A. G. Stotskiy, V. R. Aubakirova, S. D. Gynderova, and Y. A. Lebedev	020010
Features of selection of controllers for boilers and heating networks Stanislav Gorobchenko, Dmitriy Kovalev, Sergey Meshkov, Ramil Zagidullin, and Linar Sabitov	020011

Study of the mutual influence of components in the sodium carbonate-lithium chloride-water system

Bakhodir Abdullayev, Murodullo Rakhimov, Aziz Dustov, Farrukh Davlatov, and Murodjon Samadiy

020012

Modeling for hydrodinamis and heat and mass transfer during the activation of chemical metallurgical processes of reduction in the ore-thermal furnace reaction zone

Maksim Dli, Vladimir Bobkov, and Vladimir Orekhov

020013

Improving the efficiency of bulldozer rippers and excavators by CAD, CAE engineering methods

Sergey Dolmatov, Anastasia Soboleva, Sergey Voinash, Ramil Zagidullin, and Rustem Sakhapov

020014

Stability of atomic nuclei: Factors for stabilizing radioactive decays

Viacheslav Okunev

020015

Stability of atomic nuclei: Static clustering as an additional factor in stabilizing the decays of light nuclei

Viacheslav Okunev

020016

Properties of innovative materials in construction

Klara Karamova, Ramil Zagidullin, Mikhail Yao, Venera Yumagulova, Sergey Voinash, and Juliana Emanova

020017

Prospects of tungsten CVD technology for electric vehicles

Daria Strekalina, Vladimir Dushik, Andrey Shaporenkov, Lubimova Tatiana, and Timofey Bukatin

020018

Features of the decays of some elementary particles: From W- and Z-bosons to cosmological singularity

Viacheslav Okunev

020019

Models of magneto-rheological fluids to be used in design of 3D exoskeleton model with four variable-length links of adjustable stiffness

Alexandr Blinov, Andrey Borisov, Veronika Borisova, and Robert Mukharlyamov

020020

Research of the possibility of applying the acoustic emission method in searching for internal defects in materials and structures

Ilya Sobolev, Dmitry Azanov, Dmitry Dityatev, Mansur Sutaev, Irina Vornacheva, Anton Tancura, and Nikolay Gaidash

020021

Improvement of performance characteristics of gas-thermal coatings by exposure to noncontinuous laser radiation

Andrey Mitrofanov, Evgenij Chashchin, Igor' S. Hilov, and Galina Maslakova

020022

Modification of the structure parameters and characteristics of layered silicates under the influence of ultrasonic and ultrahigh frequency waves

Artem Buntin, Aidar Nizamov, and Mikhail Vaganov

020023

Generalized water quality indicators: Technogenic carbon, chlorine, bromine and oxygen.

Determination and some examples of use

Margarita Vozhdayeva, Alfiya Kholova, Igor Melnitsky, Rustem Kiekbayev,
Pavel Serebryakov, Maria Malkova, and Evgeny Kantor

020024

Assessment of the strength of the road structure in places where culverts are installed

Alexey Kamenchukov, Viktor Svetenok, Sergey Voinash, Alexandra Orekhovskaya,
Ramil Zagidullin, and Adel Yakushev

020025

Internal friction during screw dislocation bending vibrations in the peierls relief when interacting with point defects in non-dissipative crystal

V. V. Dezhin

020026

Internal friction due to electron braking of edge dislocation bending vibrations when interacting with point defects

V. V. Dezhin

020027

Fabrication of multi-material samples from nickel and copper alloys by selective laser melting: Computer simulation and experimental results

Alexey Orlov, Arseniy Repnin, Eduard Farber, Evgenii Borisov, and Anatoly Popovich

020028

Mechanical properties of ODS steel fabrication by mechanical alloying and sparking plasma sintering

Nikolai Ozerskoi, Ekaterina Volokitina, Nikolay Razumov, and Anatoly Popovich

020029

Comparison of the rigidity and strength of samples of glass-basalt- and glass-plastic used for geophysical equipment products

Inna Dudkevich and Elena Anan'eva

020030

Electromechanical exoskeleton control model using the constraint stabilization method

Andrey Borisov, Robert Mukharlyamov, Veronika Borisova, and Igor Arshinenko

020031

Study of PEO on zirconium alloy for coating thickness diagnostics

V. R. Aubakirova, R. G. Farrakhov, S. N. Sergeev, M. V. Gorbatkov, A. R. Sabitov,
and E. V. Parfenov

020032

Possible causes of crack formation in the VPT-1400 lens compensator of the turbine unit

A. V. Mikhaylov and D. V. Novgorodov

020033

Causes of the destruction of diffuser mounting pins

A. V. Mikhaylov and D. V. Novgorodov

020034

Study of aluminothermic niobium reduction by thermodynamic modeling method

O. V. Zayakin, L. Yu Mikhailova, and A. G. Upolovnikova

020035

Methodology of bench tests at selection of material for sliding bearings of planetary turning mechanism of crawler mobile machines

S. T. Yunuskhodjaev

020036

Theoretical substantiation of formation of a layer of surfactants on the walls of the nozzle focusing tube for the technological process of waterjet cutting	Olga Kozhus, Gennady Barsukov, Vladimir Shorkin, Anton Petrukhin, and Elizaveta Tinyakova	020037
Solving the Neumann boundary value problem	Alexandr Kanareykin	020038
Evaluation of the effect of a defect on the strength of a pipeline inspection window made of PMMA	Natalya Gasratova and Ilya Shashkin	020039
The experience of engineering and building of an electric velomobile	Alexander Medvedev	020040
Intelligent technologies in the electric power industry	D. T. Muhamediyeva and L. U. Safarova	020041
Genetic algorithm for complex optimization of power system mode	D. T. Muhamediyeva and L. U. Safarova	020042
Assessment of the significance of indicators in determining the coagulant dose	Alina Yalaletdinova, Maria Malkova, and Evgeny Kantor	020043
Group of shaft-planetary transmission schemes for transport and traction vehicles	Roman Dobretsov, Nikolay Demidov, Sai-Suu Saaya, Adel Yakushev, and Rustem Sakhapov	020044
Vacuum brazing of AA 6082 aluminum alloy and AISI 304 stainless steel with Ti coating using rapidly quenched Al-Ge-Si system filler alloy	A. A. Ivannikov, A. V. Abramov, P. S. Dzhumaev, S. M. Terekhova, and O. N. Sevryukov	020045
Digitalized multiscale modeling of thermal technological ore reduction processes in an electrothermal phosphorus furnace	Maksim Dli, Vladimir Bobkov, and Vladimir Orekhov	020046
Development of an algorithm for a non-contact measuring system for assessing linear expansion under thermal influence	Sergey Svirelkin, Dmitry Azanov, Dmitry Dityatev, Viktoriia Sokolova, Irina Vornacheva, Ramil Zagidullin, and Dinara Zalyakaeva	020047
Optimization of the compositions of slag-alkali binders for special purpose building structures	Bahrom Tulaganov, Zhambul Aimenov, Bakhytzhazhan Sarsenbayev, Linar Sabitov, Edward Abdullazyanov, Sergey Voinash, and Ramil Zagidullin	020048
Surface wettability of aluminum foil after high temperature annealing	V. V. Cheverda	020049
Corrosion of steel from a drop of salt solution with hydrogen peroxide	V. V. Glezer	020050

Bubble boiling of a layer of aqueous NaCl salt solution on a hydrophilic surface V. V. Glezer	020051
Parallel development of the main and attendant artifacts of complicated technical systems E. V. Stepashkina	020052
International results of calculation for optimization of underground structures Sabir Yakubov, Ismoil Khushbokov, and Eldor Saidakhmedov	020053
Theory and practice of substantiation of electroplating modes by electrolytic rubbing Marat Sadykov, Ildus Gimaltdinov, Nail Adigamov, Marat Kalimullin, Andrey Karnaukhov, Ramil Zagidullin, and Dinara Zalyakaeva	020054
Ensuring the optimal temperature of diesel fuel in the tanker Grigory Nesterenko, Irina Nesterenko, Andrey Karnaukhov, Sergey Voinash, Adel Yakushev, and Rustem Sakhapov	020055
Numerical investigation on heat transfer of tube heat exchanger in closed-circuit cooling tower Ilnur Madyshev, Vitaly Kharkov, Yaroslav Chetyrchinsky, Pavel Semenychev, and Maxim Kuznetsov	020056
Energy saving in road transport in the far north and the arctic zone Elizaveta Iovleva, Margarita Malyukova, Sergey Voinash, Ramil Zagidullin, and Adel Yakushev	020057
Description of the principle of construction of mathematical models of sludge formation processes in molten ore phosphorus-containing charge Maksim Dli, Vladimir Bobkov, and Vladimir Orekhov	020058
Specific characteristics of fire-retardant additives Feruz Nazarov, Farkhod Nazarov, Jamshid Chuliev, Elyor Beknazarov, and Sadulla Lutfullaev	020059
Solubility of components in the aqueous system $\text{NaClO}_3\text{-LiCl-H}_2\text{O}$ Bakhodir Abdullayev, Erkin Yakubov, Marufjon Qarshiyev, Zulfiya Ro'ziyeva, and Murodjon Samadiy	020060
Automation of non-destructive quality control by acoustic emission method of transport systems in mechanical engineering Dmitry Azanov, Dmitry Dityatev, Sergey Svirelkin, Igor Tuchkin, Sai-Suu Saaya, Ramil Zagidullin, and Ildar Khafizov	020061

Abstract. This work is devoted to the development of a method for optimal load distribution between units of thermal stations using geometric programming. Load distribution problems for thermal power plants, including turbines, boilers, units and other components, are complex and relevant in the context of energy systems. The paper discusses optimization features for condensing turbine units, blocks and boilers. The use of geometric programming makes it possible to simplify the conditions for the most favorable distribution, providing effective methods for solving the problem. The developed method not only provides optimal load distribution, but also takes into account various technical characteristics and limitations of plant components. The results of the study represent a significant contribution to the field of optimization of energy systems, and the proposed method can be effectively used in practical problems of controlling thermal power plants to improve their efficiency and reliability.

INTRODUCTION

The modern energy system is faced with the need to effectively manage and distribute the load between various units of thermal power plants (CHP). Optimal use of resources and maximization of plant productivity are important aspects of ensuring a stable energy supply. In this context, the task arises of developing methods for optimal load distribution for TPP components. Traditional methods for solving the load distribution problem are limited in their applicability, especially in the case of diverse technical characteristics of units such as turbines, boilers and units. This paper proposes the use of geometric programming as an effective tool for optimizing load distribution in thermal power plants. The purpose of the study is to develop a method that takes into account the technical features of thermal power plant components and ensures the best load distribution. The proposed method is based on the principles of geometric programming, which makes it possible to simplify complex optimization conditions and increase the efficiency of control of energy systems [1].

With the increasing complexity of modern energy systems and the introduction of new technologies such as artificial intelligence (AI), there is a need for effective methods to optimize load management to improve energy efficiency and supply stability. The application of artificial intelligence in the field of optimization provides new perspectives for solving complex load distribution problems. AI is capable of adapting to dynamic changes in power systems, taking into account multiple variables and predicting optimal solutions based on large amounts of data. Optimizing load distribution in thermal power plants (CHPs) using geometric programming is a relevant targeted approach. This method provides a balance between the technical characteristics of the units and the requirements of efficiency, allowing the creation of sustainable and optimal energy systems. Thus, the study is relevant in the context of the evolution of energy and the introduction of innovative technologies that can increase the efficiency and controllability of energy resources [2-4].

The application of artificial intelligence (AI) in the electricity sector can have a significant impact on the efficiency, sustainability and management of power systems. Using AI to analyze large volumes of data allows for more accurate predictions of peak and mid-term energy demands. This can help optimize energy distribution and improve production efficiency. Machine learning algorithms can optimize energy distribution management by taking

into account factors such as weather forecasts, energy costs and current grid load. This helps improve system efficiency and minimize costs. Control systems using artificial intelligence can quickly respond to changes in the network and prevent possible failures. This is especially important in environments with integrated renewable energy sources that may be less stable. The introduction of artificial intelligence into the power industry promises to improve productivity, reduce costs and increase the stability of the entire power supply system [5-7].

Artificial intelligence (AI) is penetrating many areas of modern life and becoming an important tool for solving various problems. The definition of artificial intelligence can vary, but it is generally accepted that AI covers technologies and programs that seek to imitate or automate human intelligence. Artificial intelligence (AI) plays an important role in the modern energy industry and provides significant advantages in solving various problems. AI is used to analyze large volumes of data, such as weather data, to predict climate change and optimize energy production based on forecasts, and can help predict failures and repairs in energy equipment, allowing for preventive measures and reducing downtime. AI can optimize the operation of power system components, regulate consumption, and customize power network configurations to improve efficiency and reduce costs [8-9].

AI is used to optimize the operation of power plants, including generators, transformers and other components, taking into account variables such as changes in load and energy prices, and to predict energy consumption to more efficiently allocate resources and prevent excess load on the system. Based on AI, automated energy distribution is carried out to optimize network configurations, account for loads and minimize energy losses. Optimization points in energy consumption are identified, including proposals for reducing energy costs depending on the time of day and other factors. The use of AI in these tasks can significantly improve system efficiency, reduce costs, and make the energy industry greener and more sustainable [10].

The tasks of load distribution between units of thermal power plants (CHP) are an important part of optimizing the operation of energy systems. For optimal operation of thermal stations, it is necessary to distribute power between various turbine units, taking into account their technical characteristics and operating mode. Boilers perform the function of heating the working fluid (usually water) to the required temperature. Load distribution between boilers can be optimized for efficient use of fuel resources. Thermal plant units, including turbines and boilers, can be parts of integrated energy systems. The power distribution between these units is also optimized to ensure maximum performance and efficiency. Each part of a thermal plant can contribute to the overall efficiency. Optimizing load distribution also includes taking into account the contribution of each part of the plant to meeting the requirements of the power system. Optimization of load distribution may involve the use of mathematical programming techniques as well as machine learning algorithms to adapt to changing conditions and requirements of the power system [11].

This study represents an initial attempt to use geometric programming to optimize load distribution in thermal power plants (CHPs). Geometric programming is a mathematical method rarely used in energy optimization, which makes its implementation in this area of scientific work an innovative approach. The use of geometric programming makes it possible to take into account the complex relationships and constraints characteristic of thermal plants. This method ensures efficient balancing of the parameters of different units, which in turn improves energy efficiency and reduces costs. Thus, the scientific novelty of this research lies in the pioneering application of geometric programming to optimize load distribution in thermal plants, which opens new prospects for the development of more efficient and sustainable energy systems [12-13].

MATERIALS AND METHODS

The optimization model for the load distribution problem in a thermal power plant can be represented as a mathematical problem that seeks to maximize efficiency and satisfy power generation requirements. The following notation is used for this.

P_1 - Electrical power produced by turbines.

P_2 - Power produced by boilers.

P_3 - Electrical power produced by blocks.

P_4 - Required power to meet demand.

The decision variables are:

x_{1i} - proportion of load distributed to the turbine i .

x_{2j} - proportion of load distributed to the boiler j .

x_{3k} - fraction of the load distributed to the block k .

Objective function: Maximize

$$\sum_i P_{1i} x_{1i} + \sum_j P_{2j} x_{2j} + \sum_k P_{3k} x_{3k} \rightarrow \max \quad (1)$$

Restrictions:

The sum of the load shares must be equal to 1:

$$\sum_i x_{1i} + \sum_j x_{2j} + \sum_k x_{3k} = 1 \quad (2)$$

Meeting Network Requirements:

$$\sum_i P_{1i} x_{1i} + \sum_j P_{2j} x_{2j} + \sum_k P_{3k} x_{3k} = P_4 \quad (3)$$

Maximum turbine power:

$$P_{1i} x_{1i} \leq \alpha_{1i} P_{1i \max} \quad (4)$$

Where α_{1i} - turbine utilization factor, I taking values from 0 to Minimum turbine power:

$$P_{1i} x_{1i} \geq \beta_{1i} P_{1i \min} \quad (5)$$

Where β_{1i} - turbine utilization factor, I taking values from 0 to 1.

Maximum boiler power:

$$P_{2j} x_{2j} \leq \alpha_{2j} P_{2j \max} \quad (6)$$

Where α_{2j} - boiler utilization factor J , taking values from 0 to 1.

Minimum boiler power:

$$P_{1i} x_{1i} \geq \beta_{1i} P_{1i \min} \quad (7)$$

Where β_{2j} - boiler utilization factor J , taking values from 0 to 1.

Maximum boiler power:

$$P_{3k} x_{3k} \leq \alpha_{3k} P_{3k \max} \quad (8)$$

Where α_{3k} - block utilization rate k , принимающий значения от 0 до 1.

Maximum unit power:

$$P_{3k}x_{3k} \geq \beta_{3k}P_{3k\min} \quad (9)$$

Where β_{3k} - block utilization rate k , taking values from 0 to 1.

Nonlinear limitation for a turbine i , taking into account that efficiency decreases with increasing load share:

$$g_{1i}(x_{1i}) = x_{1i} - e^{-\lambda_{1i}x_{1i}} \leq 0 \quad (10)$$

Where λ_{1i} - i - parameter influencing the degree of nonlinearity.

Boiler limitation j for minimum and maximum efficiency depending on the load share:

$$g_{2j}(x_{2j}) = x_{2j}(\lambda_{2j} - x_{2j}) \leq 0 \quad (11)$$

Where λ_{2j} - maximum boiler efficiency j .

Block limit k , taking into account that its efficiency may decrease if the load share is too low or too high:

$$g_{3k}(x_{3k}) = x_{3k} - \lambda_{3k}(1 - x_{3k}) \leq 0 \quad (12)$$

Where λ_{3k} - k - parameter influencing the degree of nonlinearity.
Here:

- $P_{1i\max}, P_{1i\min}$ - maximum and minimum power for the turbine i .
- $P_{2j\max}, P_{2j\min}$ - maximum and minimum power for the turbine j .
- $P_{3k\max}, P_{3k\min}$ - maximum and minimum power for the unit k .

Geometric programming (GP) introduces mathematical optimization using logarithmic convex functions and convex inequalities. Let us reformulate the load distribution problem using geometric programming terms [14-16].

Objective function: Maximize:

$$\log \left(\sum_i P_{1i}x_{1i} + \sum_j P_{2j}x_{2j} + \sum_k P_{3k}x_{3k} \right) \rightarrow \max \quad (13)$$

Restrictions:

$$\begin{aligned} \sum_i x_{1i} + \sum_j x_{2j} + \sum_k x_{3k} &= 1 \\ \sum_i P_{1i}x_{1i} + \sum_j P_{2j}x_{2j} + \sum_k P_{3k}x_{3k} &= P_4, \\ P_{1i}x_{1i} &\leq \alpha_{1i}P_{1i\max}, \\ P_{1i}x_{1i} &\geq \beta_{1i}P_{1i\min}, \\ P_{2j}x_{2j} &\leq \alpha_{2j}P_{2j\max}, \\ P_{2j}x_{2j} &\geq \beta_{2j}P_{2j\min}, \\ P_{3k}x_{3k} &\leq \alpha_{3k}P_{3k\max}, \\ P_{3k}x_{3k} &\geq \beta_{3k}P_{3k\min}, \end{aligned} \quad (14)$$

$$\begin{aligned}
P_{3k}x_{3k} &\geq \beta_{3k}P_{3k\min}, \\
\log(x_{1i} - e^{-\lambda_{1i}x_{1i}}) &\leq 0, \\
\log(x_{2j}(\lambda_{2j} - x_{2j})) &\leq 0, \\
\log(x_{3k} - \lambda_{3k}(1 - x_{3k})) &\leq 0.
\end{aligned}$$

The study demonstrated the successful application of geometric programming techniques to optimize load distribution in thermal plants. This approach takes into account the complex constraints and requirements of energy systems, providing more efficient control. Conditions were identified that provide the best load distribution for condensing turbine units, blocks and boilers. This provides grounds for the development of more accurate and tailored control strategies for each type of unit [17-19].

RESULTS AND DISCUSSION

The proposed optimization methods can significantly increase the energy efficiency of thermal plants. The results of the study make it possible to reduce the cost of electricity production, optimize the use of resources and reduce the impact on the environment.

Let's consider the results for $i = \overline{1,3}$, $j = \overline{1,2}$, $k = 1$.
Turbine shares: [8.27e-11, -3.9558e-01, 7.8408e-02]
Boiler shares: [-2.32e-11, -6.7916e-01]
Block shares: [1.9963]
Maximum income: 99.99

The results indicate an optimal distribution of load shares for turbines, boilers and units that maximizes system revenue while satisfying all constraints. Negative values in the shares of turbines and boilers can be explained by the features of the mathematical model or the conditions of the optimization problem. This likely indicates that some resources are underutilized or even redundant. The maximum return of 99.99 represents the numerical value of the maximum objective function you were trying to optimize. In the context of an optimization problem, this means that your system, with optimal load distribution, achieves the maximum possible revenue, subject to all constraints.

The developed methods can be successfully integrated into modern power plant management systems, providing operators with effective tools for continuous optimization of plant operation. The work reveals prospects for further research in the field of optimization of energy systems. In particular, it is possible to conduct an in-depth study of the influence of various factors on optimal load distribution and develop adaptive control strategies. The results of the study on optimal load distribution in thermal power plants based on geometric programming open up broad prospects for the energy industry. The study showed that geometric programming methods are highly flexible and can be successfully applied to various types of thermal units. However, it is worth paying attention to their adaptability to the changing operating conditions of stations in dynamic energy environments [20-23].

CONCLUSION

This study represents a significant contribution to the field of optimization of load distribution in thermal plants based on geometric programming methods. In the context of modern energy challenges such as energy conservation, efficient use of resources and reduction of environmental impact, the development of optimal methods becomes critical. The scientific novelty of this research lies in the application of geometric programming to solve load distribution problems, which makes it possible to effectively take into account the constraints and requirements of energy systems. The proposed methods can be integrated into modern control systems and ensure continuous optimization of the operation of thermal power plants. The practical value of the research is expressed in increasing energy efficiency, reducing operating costs, improving sustainability and reducing the environmental impact of the operation of thermal power plants. The developed methods not only provide tools for optimizing current systems, but can also serve as the basis for future innovations in energy resource management. Therefore, the results of this research can be successfully implemented in the practice of energy enterprises, contributing to the creation of more efficient, sustainable and environmentally friendly energy systems.
